STUDY ON CHRONIC PAIN IN PATIENTS WITH DEMENTIA

We are searching for patients with Alzheimer's dementia rated at mild or moderate stage of severity who

- have chronic pain for at least 3 months
- live in a rural area, and
- are cared for by a caregiver at home.

Their caregiver will be invited to participate in the interview study as well to learn more about their needs in pain management.

This study involves:

- completing two surveys, one for the patient and their caregiver (20 minutes) and one for the caregiver only (15 minutes), and
- two interview appointments (taking 70 minutes in total)

Your total participation in this project requires to give a maximum of 2 hours of your time.

Both patient and caregiver receive a 50\$ gift voucher for completing both surveys and interviews.
